6/26/2024
User will input password and the system will check the database. If the password matches, the system will display a welcome message and the application will close. If the password is invalid, the system will return the user to password input. After three failed attempts, the system will lockout the user account and the application will close.

Password Input

Check

Database

print("Incorrect Password")

else

input() = "Password" **else**→ invalid_input_attempt = 3 **if**→ system.lockout

if

system.access → print("Welcome 'username'!")

print("Account Locked")

system.exit
